Let's Travel

So, we are basically coming up with the idea of a travel app. Through the app, customers can purchase Bus,Train, Ship, Launch, Airline tickets which are performing service throughout Bangladesh. Also, customers are able to do hotel booking in tourist areas and major cities of the country. Our goal is to include every type of hotel available in the particular places.

There will be two interfaces in our project.

● One interface will include our partners e.g. hotels, airlines, guides and others who would provide service to our customers. Our administrative staff would register their information which would be accessible by our customers. There will be classes for each type of our partners so that it can be accessible by others. The staff can also access the accounts of the company as we would receive digital payment from the customers. Here the wallet of the customers and payment to our partners and the accounts of our company is to be managed. We would take bank account details of both our customers and partners such that we can manage the payment protocol. Also, our administrator would make packages for the customers.

- The second interface is for our customers. Customers can perform a single purchase. Apart from that there would be tour packages which would include various prices according to the period and quality of the package. There would be two categories of customers- International and Local. If an International customer needs a guide, then the guide must know English. Customers must register to our system to make purchases. Customers can also create custom packages according to their convenience and get discounts on the whole.

It is our primary idea for the project. We wish to make it much better while working with the idea.
